

Astra and Opus

Five challenging parts

Prepared by Ryan | 7 October 2026

Independent block layouts and realized hexahedral meshes for five selected CAD geometries. Each model received the same geometry, layout preferences and fixed acceptance checks.

GPT 6 Astra

5 / 5 counted

\$15.07 API equivalent | 61.55 min

Opus 5.5

4 / 5 counted

\$31.97 CLI usage | 176.72 min

All ten final meshes pass geometry checks.

One Opus attempt remains rejected by the fixed command audit. Its logs indicate an apparent false positive from echoed command text; the rejection has been retained. Each model used 10 full mesh revisions in total.

HOW TO READ THIS REPORT

Each following page shows the original CAD, followed by the two model results: block layout, aligned top-down mesh and isometric mesh. SJ (scaled Jacobian) measures element quality; larger values are better, with a fixed minimum of 0.2. Low SJ is yellow; high SJ is lavender. Statistics include all cells; mesh colors show exposed surfaces.

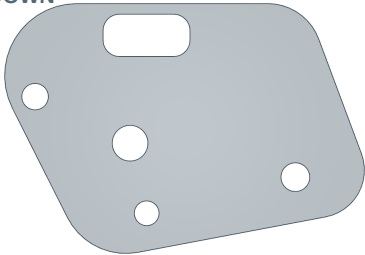

Selected showcase, not a population benchmark: these geometries had previously verified meshes, which were withheld from authors. Astra used medium reasoning effort; Opus used high. Usage figures have different accounting bases and are not subscription invoices. No human quality grades were assigned.

Rounded plate with bores and slot

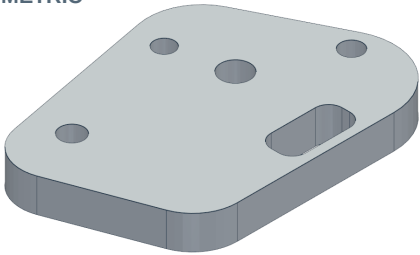

Original CAD

Unmodified input geometry.
Top and isometric views use the same orientation as the meshes below.

TOP DOWN

ISOMETRIC

Views and quality

Top-down meshes are projections of the actual 3D mesh, not separate 2D meshes.
Both densities were independently checked.
